**NEW!**

Wound management at your fingertips.  
Hydrosorb® Gel – in a practical dosing syringe.

# Get to grips with wound management.

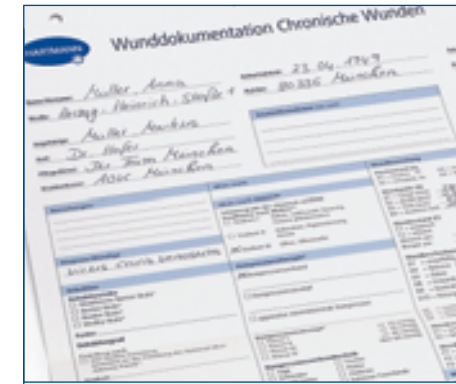

## Hydrosorb® Gel – application as easy as 1, 2, 3.

Hydrosorb Gel from HARTMANN is an amorphous hydrogel which is used for the treatment of almost dry chronic wounds. The transparent gel facilitates necrosis detachment by permanently releasing moisture into the wound. Rounding off a comprehensive treatment concept, Hydrosorb Gel helps to reliably cleanse the wound. What's more, it can be combined with all (wound) dressings.

### Safe dosing

The syringe enables accurate dosing, dispensing the gel with the tip directly into the wound with no mess, and thus minimizing the risk of application errors.

### Simple documentation

The wound volume and the amount of gel still available can be accurately determined to the nearest milliliter by two scales.

### Saves a lot of time

The ease of use of the syringe mechanism ensures reliable dosing of the gel, saving valuable time.

### High cost-efficiency

Unlike tubes, where a lot of gel often tends to be left unused, the Hydrosorb Gel syringe can be effectively emptied. Also, the syringe can be re-sealed whenever there is a need to interrupt treatment.

### Combines flexibly and causes less pain

Hydrosorb Gel enables quick wound cleansing thanks to its hydroactive effect. It can be combined with all wound dressings and minimizes pain during dressing changes.
